		any table(s) related to the sequence l						
								
*	If item	4 applies, some or all of those sheets may be m	arked "superseded."					

Box No. V	Reasoned statement u	nder Article : ions supporti	35(2) with regard to novelty, ing such statement	nventive step or industrial applicab	ility;
1. Statement	t				
Nove	elty (N)	Claims	1-11		YES
		Claims			_ NO
Inven	ative step (IS)	Claims	1-11		YES
		Claims			NO
Indus	strial applicability (IA)	Claims	1-11		YES
		Claims			NO

2. Citations and explanations (Rule 70.7)

The following documents were cited in the International Search Report:

D1: WO0178970 A1
D2: US6341808 B1
D3: US5192070 A1
D4: EP1083032 A1
D5: US4389365 A1
D6: JP2002173250 A1

Amended claims 1-11 were filed on 2004-10-01 together with a statement.

The cited documents represent the general state of the art. The invention defined in claims 1-11 is not disclosed by any of these documents.

The cited prior art does not give any indication that would lead a person skilled in the art to the claimed device for removing an object from a moulding tool. Therefore, the claimed invention is not obvious to a person skilled in the art.

Accordingly, the invention defined in claims 1-11 is novel and is considered to involve an inventive step. The invention is industrially applicable.

INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY

Internation plication No.

PCT/SE 2003/001590

Box No. VII Certain defects in the international application

The following defects in the form or contents of the international application have been noted:

Claim 7 and the description page 8, line 20 refer to sealing means (18). However, in figure 1 the sealing means have the reference number (8).

JC12 Rec'd PCT/PTC 1 7 APR 2005

CLAIMS

- A device (1, 38, 42) for removing an object from a moulding tool (2, 30, 44) in connection with casting or moulding an object, wherein there is a retaining force between the moulding tool and 5 the object, wherein the device comprises a body (5, 39, 43) designed with a contact surface (9) adapted for at least partly being in contact with the object and coupling means arranged for coupling the object to the body, characterized in that the body is provided with means (40, 46) for applying a traction force on the 10 object, which traction force is substantially opposite to said retaining force, and the coupling means is arranged to couple the object to the contact surface such that said traction force becomes substantially uniformly distributed over the part of the surface of the object that is in contact with the contact surface. 15
 - 2. A device according to claim 1, <u>characterized in</u> that said means (40, 46) for applying a traction force on the object is arranged for co-operation with the moulding tool (30, 44) for applying the traction force on the object.
 - 3. A device according to claim 1 or 2, <u>characterized in</u> that the moulding tool (30) is provided with ejection means for ejecting the device 33 from the moulding tool, and that said means (40) for applying a traction force on the object is arranged for cooperation with the ejection means in such a way that the movement of the ejection means is transformed to a traction force on the device.
- 4. A device according to claim 1 or 2, characterized in that said means for applying a traction force on the object comprises push-away members (46) adapted to bear on the moulding tool and to apply a force between the moulding tool and the device, which force acts separating on them.

20

25

5. A device according to any of the previous claims, <u>characterized in</u> that the body comprises at least one section made of an substantially inelastic material and said section being arranged in connection to the contact surface (9).

5

- 6. A device according to any of the previous claims, <u>characterized in</u> that said coupling means is arranged for coupling the object to the contact surface by means of under-pressure and that said coupling means is arranged so that it creates said underpressure between the contact surface (9) and the object (3).
- A device according to claim 6, <u>characterized in</u> that the coupling means comprises sealing means (18) arranged for sealing between the contact surface (9) and the object (3), and at least one coupling channel (13) being arranged in connection to the contact surface (9), wherein the coupling channel is arranged for transporting air away from the contact surface.
- 8. A device according to any of the claims 6 -7, characterized in that it comprises at least one air-permeable contact means (17) having a surface, which is at least a part of the contact surface and arranged to be in contact with the object (3) in such a way that deformation of the object is counteracted.
- 9. A device according to claim 8, <u>characterized in</u> that the contact means (17) comprises a plurality of elements arranged such that cavities are formed between them, wherein transportation of air is admitted through the contact means.
- 30 10. A device according to the claims 8 or 9, characterized in that the contact means (17) is substantially made of a sintered metal or a sintered metal alloy.
- 11. A device according to any of the claims 7 10, <u>character-</u>
 35 <u>ized in</u> that the contact means (17) is arranged such that transportation of air from the contact surface (9) to the coupling

channel (13) occurs through the contact means, and that said sealing means (18) is arranged so that it surrounds the contact means.
